Worldwide Level and Flow SolutionsSM

TECHNOLOGY

LOW-VOLTAGE PULSE ①

On-board electronics send a low-voltage electrical pulse down the magnetostrictive wire at the speed of light, ten times per second.

MAGNETS ②

Magnets contained within the float focus their energy toward the wire at the precise location of the liquid level.

TWIST ③

Interaction between the magnetic field, electrical pulse, and magnetostrictive wire cause a slight mechanical disturbance in the wire that travels back up the probe at the speed of sound.

PIEZOELECTRIC CRYSTALS ④

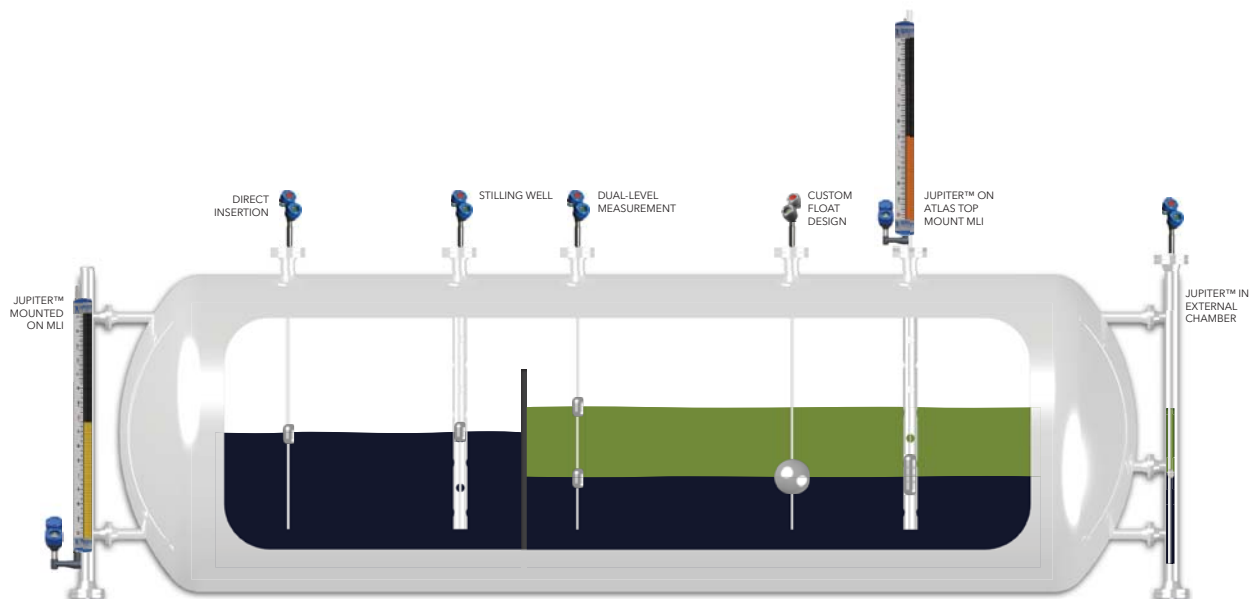

The mechanical wave is converted back into electrical energy by two piezoelectric crystals. The on-board electronics interpret the time-of-flight data and indicate the position of the float magnets.

APPLICATIONS

As direct insertion model: Jupiter can be mounted inside a bridle, stillwell, external cage or directly inside the vessel.

As external mount model: Jupiter can be mounted on the outside of a magnetic level indicator (MLI).

FEATURES

SAFER

Jupiter possesses a comprehensive array of advanced diagnostics and real-time performance monitoring which make gathering transmitter insight faster and easier than ever before. With profound focus on SIS (Safety Instrumented Systems), Jupiter was developed with SSA (Safety Suitable Architecture), as well as memory protection hardware & software.

In addition, such features as non-volatile event history information, hot swappable control modules, configurable alarm delays and context sensitive help screens and parameters makes this one of the easiest transmitters on the market to work with.

REMOVABLE & ROTATABLE TRANSMITTER HEAD

A first among magnetostrictive devices, Jupiter revolutionizes installation options and flexibility with a transmitter head which can rotate up to 310 degrees, drastically improving LCD visibility and access to the user interface in hard-to-reach places. In addition, a removable head minimizes installation challenges, permits interchangeability without breaching the process seal, and allows for remote transmitter placement.

SMARTER

Orion introduces auto-configuration to magnetostrictive technology with Jupiter's new Smart Probe. When the transmitter head connects to a probe for the first time, configuration settings stored within the probe's memory are instantly transferred. In addition, parameters critical to the instrument's calibration are transferred as well, eliminating the need for Jupiter to be manually calibrated in the field. This unique capability expedites the setup process and simplifies the task of installing spare transmitter heads on existing or replacement probes.

SIMPLE, FEATURE-RICH USER INTERFACE

Jupiter takes the user experience to new levels of convenience and functionality with an information-rich display and an easy-to-navigate menu. With the new graphic LCD, waveforms are viewable locally at the device. You can also interface with Jupiter via a capable DCS or handheld communicator that utilize DDs/EDDL for remote connectivity.

A fully redesigned and upgraded DTM puts real-time and historical trend data at your fingertips. With a basic laptop, a HART modem, and the free-to-download program PACTware™, the transmitter can be accessed locally or from anywhere in the loop. You can also capture live waveforms, which are invaluable when configuring the transmitter for optimal performance.

OPTIONS

REMOTE MOUNTED ELECTRONICS

Remote mount option, ideal for installation space constraints.

VIBRATION KIT

Silicone-based damping material eliminates metal-on-metal contact between the probe and the chamber. Increases signal stability in high vibration applications by reducing mechanical noise.

SUNSHADE

Reduces glare and radiant heating of the transmitter enclosure. Also minimizes impact of direct solar radiation to the graphic liquid crystal display.

CENTERING DISC

The centering disc is an invaluable aid when utilizing the Jupiter in a direct insertion environment, such as a stilling well or modular instrumentation bridge. By keeping the transmitter probe centered, potential for impingement is mitigated.

Units mounted in stilling wells or chambers are provided with centering disc at the base of the probe, guaranteeing free movement of the float.
